A CLINICAL EVALUATION OF ERANDADI TAILA NASYA AND KARNAPURANA AND SARSHAPA TAILA KARNAPURANA IN THE MANAGEMENT OF KARNA NADA W.S.R. TO TINNITUS

RAKESH BISHNOI¹ GULAB CHAND PAMNANI²

ABSTRACT:

**Background:** Tinnitus is ringing sound or noise in the ear or head. The characteristic feature is that the origin of this sound is within the patient. Tinnitus is more annoying in quiet surroundings, particularly at night, when the masking effect of ambient noise from the environments lost. Epidemiologic studies have consistently reported that tinnitus prevalence in adults range from about 10 to 15 percent of the population worldwide.

**Objectives:** 1. To evaluate the efficacy of Erandadi Taila Nasya and Karnapurana in the patients of Karna Nada- Tinnitus. 2. To evaluate the efficacy of Erandadi Taila Nasya and Sarshapa Taila Karnapurana in the patients of Karna Nada- Tinnitus.

**Material and Methods:** In present study 32 patients of Karna Nada (Tinnitus) were selected and divided into two equal groups of 16 patients each. In group- I, patients were advised Erandadi Taila Nasya and Karnapurana and in group- II, patients were advised Erandadi Taila Nasya and Sarshapa Taila Karnapurana. Data obtained was statistically analyzed.

**Results:** Group- II was found to be providing better relief as compared to group- I.

**Conclusion:** There is a minute difference in percentage of relief in 2 groups under consideration. So no concluding statement can be given until the same trial is carried out on large sample size.

**Key Words:** Karna Nada, Tinnitus, Erandadi Taila, Nasya, Sarshapa Taila, Karnapurana.

INTRODUCTION

Epidemiological studies demonstrated that 15-20% of the adult populations experience some form of tinnitus and one out of five affected patient’s claims to be emotionally affected\(^1\). Tinnitus is considered to be the third worst symptom for humans, surpassed only by intense and intractable pain and dizziness\(^2\).

Acharya Sushruta says when Vayu covered with Doshas taking faulty passage get located in sound carrying channels, then the patient perceives various types of sound; this disease is known as Pranada or Karna Nada\(^3\). This disease can be correlated to tinnitus on the basis of sign and symptoms. Tinnitus is ringing sound or noise in the ear or head. The characteristic feature is that the origin of this sound is within the patient. Usually, it is unilateral but may also affect both ears. It may vary in pitch and loudness\(^4\).

In modern science there is no effective treatment for this disease and incidences of tinnitus are increasing day by day. Hence this study is planned to explore an easily available and cost effective treatment without any adverse effects.

As Nasya is an important procedure advocated in all Urdhwa Jatragata Vikaras, hence the same has been considered. Erandadi Taila is selected for Nasya which is an important formulation having Vatashamaka properties\(^5\).

Karnapurana is an important procedure advocated for all Karna Rogas. Karna being one of the Adhisthana of Vata Dosha, Snehana becomes important to control the localised increased Vata Dosha. Hence, Karnapurana also gains importance in the management of the disease. Sarshapa Taila Karnapurana is highly recommended by all Acharyas in Karna Nada\(^6\).

AIMS AND OBJECTIVES

- To evaluate the efficacy of Erandadi Taila Nasya and Karnapurana in the patients of Karna Nada- Tinnitus.
- To evaluate the efficacy of Erandadi Taila Nasya and Sarshapa Taila Karnapurana in the patients of Karna Nada- Tinnitus.

MATERIALS AND METHODS

Study design: Interventional, randomized clinical trial.

Study population: Patients participated in the study taken from in and around Jaipur.

Sampling: Simple random sampling technique was followed using lottery method.

Sample size: A total of 30 patients of Tinnitus, willingly participating in the study from in and around Jaipur.

Study setting: The study was carried out in National Institute of Ayurveda, Jaipur, Rajasthan from March 2016 to February 2017.
Jaipur is a district headquarters with a population of about 3046189.

**Formulation of the Drug**

Both medicines were manufactured in the pharmacy of National Institute of Ayurveda (GMP certified), Jaipur (Rajasthan).

**Preparations of Drug**

_Taila_ prepared for this project is made by using the method of _Sneha Kalpana_ mentioned in _Sharandhara Samhita_\(^7\).

**Table No. 1: Composition of Erandadi Taila\(^8\).**

_Swarasa_ of all drugs was prepared and then Swarasa, Kalka, Go-Dugdha and Taila mixed and boiled till Samyaka _Snehana Lakshanas_ occur as noted in texts.

Due to unavailability of _Kshirakakoli_, _Ashwagandha_ was taken as _Pratinidhi Dravya_\(^9\).

**Inclusion Criteria**

- Patients in the age group of 20 - 80 years with intact and normal tympanic membrane.

**Exclusion Criteria**

- Congenital deformity.

- Patients presenting with symptoms of _Karna Nada_ irrespective of sex, caste and religion.
• Patient of Otosclerosis and fluid in the middle ear.
• Blockage due to stenosis of external auditory canal/wax.
• Pregnant, immuno compromised patients.
• Tinnitus due to non otologic factors (Diabetes mellitus, Hypertension, Thyroid disease etc) and glomus tumour, aneurysm of carotid artery, palatal myoclonus and tumour of auditory nerve.

Grouping of patients

In the present study 32 clinically diagnosed patients of Karna Nada (Tinnitus) were selected and randomly divided into two groups (Group-I - 16 patients, Group-II - 16 patients) out of these 32 patients 30 patients completed the trial.

Group I- 16 patients of Karna Nada were given Nasya and Karnapurana with Erandadi Taila.
Group II- 16 patients of Karna Nada were Erandadi Taila Nasya and Sarshapa Taila Karnapurana.

Duration of Trial: 30 days
Follow up: All the patients were followed up once a two week for a period of one month.

CRITERIA OF ASSESSMENT

Both subjective and objective parameters were employed for the assessment of the effect of the treatment.

Subjective criteria

The effect of treatment was assessed by asking following questionnaire form the patients\textsuperscript{[11]}.

Table No. 3 questionnaire for assessment of effect of treatment

<table>
<thead>

</tr>
</tbody>
</table>

**Laboratory criteria**

- It includes Hb%, FBS/RBS.
- Blood pressure of all the patients was measured.

**Statistical analysis**

The data obtained was statistically analysed.

**OBSERVATION AND RESULTS**

Total 32 patients were registered in clinical study; amongst them 30 patients completed the treatment and 02 patients discontinued the treatment.

DISCUSSION

Nasya

Acharya Charaka described that Nasa is the only gate way to Shirah[12]. Before the Nasya Karma, Sthanika Abhyanga with Erandadi Taila and Swedana is given which helps in stimulation of vasodilator nerves which are spread out on the superficial surface of face, this increases the blood circulation to the brain.

Karnapurana

In Purva Karma, Snehana and Swedana were performed. Generally the medicated oil is used in Karnapurana, Taila is having virtue of Vata Shamana but do not aggravate Kapha. In this way Karnapurana eliminates disease of ear which occurs due to vitiation of Vata. In
addition medicine is used luke warm so Vata is eliminated by Ushna Guna also. These properties do not only have beneficial effect on Vata but also removes Avarana of Kapha. As medicine for Karnapurana is made by Snehapaka method, all fat soluble active ingredients of drug get enclosed. Fat soluble active principle can be easily assimilated through nerve endings. As a combine effect of all these Karnapurana is useful in Karna Nada.

**Discussion on effect of therapies on chief complaint- Karna Nada**

Relief in the symptom of sound in the head and ears was observed 52.38% in Group- I (p<0.0001), and 54.38% in Group- II (p<0.0001) and all these values were statistically extremely significant.

However there was insignificant (p>0.05) difference between BT and AT scoring of two groups (p=0.06) even though Group- II showed 2.00% more relief than Group- I.

**Discussion on effect of therapies on associated symptom- Badhirya**

Relief in the symptom of hearing loss was observed 22.60% in Group- I (p=0.062), and 7.83% in Group- II (p=0.50) and all these values were statistically insignificant (p>0.05).

However there was insignificant (p>0.05) difference between BT and AT scoring of two groups (p=0.97) even though Group- I showed 14.77% more relief than Group- II.

**Overall effect of therapy**

The overall effect was decided on the basis of improvement in Subjective parameters.

**In Group- I**

60.00% patients showed mild improvement, 33.33% patients showed moderate improvement and 06.67% patients showed marked improvement. None of the patients found complete remission and unchanged result.

**In Group- II**

53.33% patients showed mild improvement and 46.67% patients showed moderate improvement. None of the patients found complete remission, marked relief and unchanged result.

**CONCLUSION**

Statistically extremely significant relief (p<0.0001) were found on Karna Nada in both groups. On associated symptom Badhirya, statistically insignificant (p>0.05) improvement was observed. In comparative study over criteria of assessment, statistically insignificant (p>0.05) difference in Karna Nada and Badhirya was observed. The follow up study showed long term sustained relief as evident from 30 days follow up. Prolonged duration of therapy may provide better results and prevent the relapse of the disease. No adverse and toxic effects were observed during and after the trial. In nutshell, Ayurveda proved better in the management of the disease in
comparison to modern aspect i.e. Erandadi Taila Nasya and Karnapurana and Sarshapa Taila Karnapurana proved to be a good effective and safe therapy to subside the disease.
